ABSTRACT

Fycka Restina Naue. 2015. The Effect of the Use of Baby Oil toward *Diaper Dermatitis* at Regional Public Hospital (RSUD) of Toto Kabila, District of Bone Bolango. Skripsi, Department of Nursing, Faculty of Health and Sport Sciences, Universitas Negeri Gorontalo. The principal supervisor was Dr. Lintje Boekoesoe, M.Kes and the co-supervisor was Ns. Nasrun Pakaya, M.Kep.

Baby oil is an essence functioned to moisten the skin, which often used to handle or prevent the dry skin of baby. The impact of dermatitis includes the infection at baby's perianal area.

The research applied pre experimental approach by having static group comparison design. The sampling technique was accidental sampling. The data were collected through observation and analyzed through Mann Whitney test.

The research result showed that the diaper dermatitis occurred to the respondents who use baby oil as 2 respondents and those who did not use baby oil as 7 respondents. The research result showed that there was an effect of the use of baby oil to diaper dermatitis incident on babies at Regional Public Hospital (RSUD) of Toto Kabila, District of Bone Bolango. It is suggested to prevent the diaper incident by changing the baby's diaper to the dry one and let the baby's bottom is contacted by the air before covering with the diaper.

Keywords: Baby Oil, Diaper Dermatitis
