ABSTRACT

Maternal and child health program (KIA) is a means of health concerning pregnant woman care, giving birth mother, breastfeeding mother, baby, toddler, and preschool child. Problem faced by Puskesmas Limba B has been revealed such as data and information collected manually by midwife have led to frequently late report and not accurate and also there is no database which will cause difficulty of data finding which are needed especially for program activity evaluation need of KIA at Puskesmas. This research aims at designing program evaluation information system of KIA to observe the development of Maternal and child health program (KIA) based web mobile. Research method uses research and development. Research findings show that using service information system development of Maternal and child health program (KIA) based web mobile can help society to access child and mother health service information. This mobile application can help the health workers to manage data and support the KIA program evaluation therefore the result of mother and child health is accurate and efficient.

Keywords: Information System, maternal and child health Program (KIA), web mobile
