

CHAPTER V

CONCLUSION AND SUGGESTION

Conclusion

After presenting the result of this research, in this part, I would like to present the conclusion and suggestion as follows:

Based on the result of pre test data, it can be conclude that the total right score of all students was 597, whereas in the post test, the students' total right score was improved to 778. The students lowest score in pre test was 16, in post test the students' lowest score was improved 19. The students' highest score in pre test was 24, whereas in post test was improved to 29.

In addition, by seeing this result of research, it can be said that all the aspect in all calculating data there were improved.

Based on calculating of testing hypothesis, it can be seen that there was differences between t_{count} and t_{list} , where $t_{count} \leq t_{list}$. It means that the hypothesis of this research was received, it can be conclude that the students' reading ability can be improved by using Porpe method.

Suggestion

Based on the result of research, it can be suggest to the students have to pay attention to their reading ability especially in finding and understanding explicit and implicit meaning in a text, because it was found that the lowest students score in each aspect of reading was in explicit and implicit meaning in a text.
